NOVEL LOW-POWER CMOS VLSI DESIGN USING FEDERATED LEARNING BASED ADIABATIC SWITCHING PRINCIPLE

J. Muralidharan¹, Manasi Dnyanesh Karajgar², N. Kanagavalli³ and S. Sudha⁴ Department of Electronics and Communication Engineering. KPR Institute of Engineering and Technology. India

¹Department of Electronics and Communication Engineering, KPR Institute of Engineering and Technology, India Department of Artificial Intelligence and Data Science, D Teatl College of Engineering India Department of Computer Science and Engineering, Bajabathin Istatute of Flectundogy, India ¹Department of Electronics and Communication Engineering, Sri Raegunathan Institute of Engineering and Technology, India

Abstract

This research introduces a groundbreaking approach to low-power CMOS VLSI design by leveraging the principles of federatel learning and adubatic switching. The ecolution domain of one energy-efficient integrated circuits necessitates innovative methodologies to mitigate power consumption while maintaining performance. Existing VLSI designs often face challenges in a decivine optimul power efficiency, resulting in a research gap that this study aims to address. Our proposed method integrates federated learning, a decentralized machine learning paraligm, while the adubative waitching principle, which involves gradual energy transitions. By employing federated learning for optimizing power consumption at distributed modes and implementing admitted, while for energy-efficient transitions between logic states, the norel VLSI design promises to revolutionize The core problem addressed in this research is the inefficiency of current VLSI designs in meeting the growing demand for lowpower consumption. The inability to strike an ideal balance between power efficiency and performance hinders the progress of semiconductor technology, necessitating a reevaluation of design methodologies.

The primary objectives of this study include formulating a novel VLSI design method that integrates federated learning and adiabatic switching principles. The aim is to achieve substantial reductions in power consumption while maintaining or even enhancing overall performance. This research seeks to provide a viable solution to the persistent challenges associated with lowensure (2006; NEI advime).
